55LB BOX BITUMINOUS ADHESIVE

**Hot melt adhesives are a cleaner, quicker setting alternative to traditional epoxy. Peel and stick uncured butyl rubber pads are great for the temporary installation of channelizers.**

## **Proper surface preparation is essential:**

- Surface should be dry and swept or blown free of debris.
- New asphalt and concrete surfaces must have had sufficient time to set.
- Alternate products should be used if the surface has frequent standing water, is frequently irrigated or has an abnormally high moisture content.

## **Tech notes:**

- A propane roofer's or weed burner type torch is required to evenly melt Bundy pads. The small torches that screw into a propane cylinder do not produce enough heat to evenly melt adhesive pads.
- While peel & stick butyl pads work well for the application of surface mounted channelizers, they are not a good choice for pavement markers or other objects that are regularly driven over. Objects attached with butyl pads can usually be removed without damaging the pavement.
