OVERLAY MARKER

Temporary markers are used during paving and sealing operations to mark lane lines and utility covers.

Tech notes:

- Temporary Overlay Markers are typically used to mark lane lines for the period of time between paving and re-striping.
- Chip seal markers have a clear plastic cover. These markers serve the same purpose as an Overlay Marker, except that they're placed atop existing lane line prior to sealing the road surface. Once the seal has set, the clear plastic covers are removed exposing a clean reflective surface.
- Utility cover locators, also known as I.D. Locators and witch hats, are used to locate manhole, valve and other utility covers during repaving work. The markers are applied prior to the overlay, which is then laid over the cover leaving just the tip of the marker exposed. The markers make it easy to locate the lids when the utility covers are brought up to the new grade.
